See *meteorite*. =**Syn.** *Form, Conformation, Figure, Shape, Fashion.* *Form* is the general word; and its use in ordinary speech has been much influenced by its metaphysical meaning, so that it is the least geometrical of these words. When *form* refers to the outward, it generally suggests the substance of the person or thing whose form it is; *form* may also be used in opposition to *spirit* or *substance*: as, "a *form* of godliness," 2 Tim. iii 5. *Conformation* is the result of the arrangement of the parts of a whole, and the word suggests the proportion and relation of the parts, internal or external, to each other. *Figure, shape*, and *fashion* are external; the first is often, and the others are generally, the result of art. *Figure* has a wide range of meaning, from mere outline to pictorial or fictile representation. *Shape* has almost as much freedom of use; yet, having been little used as a learned term, it is more literally geometrical, and at the same time more loosely employed *Fashion* in the sense of *form* is obsolescent.

Milton, Apology for Smectymnuus

figure-casting (fig'ūr-kas'ting), *n.* The art of preparing casts of human or animal forms and of various other complex objects. A figure is first accurately formed in wax, clay, plaster, or other suitable material, which serves as the core. If the core is fusible, or can be reduced to ashes, the mold is formed directly upon the core, and when it is perfectly dry and hard it is exposed to a heat sufficient to melt or incinerate the core, the removal of which leaves a cavity for the metal of the cast. This method gives a solid casting, and is therefore suitable for small work only, moreover, the model itself is destroyed by one use. Exquisite casts of natural objects are made in this manner. If the core cannot be removed in the way mentioned, the mold itself is made in parts to permit its removal.

figurehead (fig'ūr-hed), *n.* **1.** An ornamental figure, as a statue or bust, on the projecting part of the head of a ship, over the cutwater and immediately under the bowsprit. If the vessel's name is that of a person, object, etc., which can be represented directly or emblematically by a figure, such a figure is usually placed at the head of the vessel, thus, the *Columbus* would have a bust or statue of Columbus for a figurehead, the *Lion* would have the figure of a lion, the *Britannia* a statue or bust of the conventional Britannia. When no figure is used, the head is often finished off as a *scroll head* or a *fiddle head* (see these terms), which are not strictly figureheads.

Tanagra figurine, in *archæol.*, one of the small terra-cotta figures of divinities, of mortals, or of animals, found in various quantity and perfection throughout Greek lands. These figures were in great demand among the Greeks as household ornaments, and it was usual to present them as offerings in temples, and to bury several of them with a dead body. They were, as a rule, cast in molds and then finished, often very delicately, by hand, and after the baking they were brilliantly colored. In them is preserved a charming memorial of Greek private life in its various phases, such as the games of the children and the occupations of the women. They are commonly known as *Tanagra figurines*, because those first brought into public notice, as well as some of the most beautiful examples since found, come from the cemetery of Tanagra in Bœotia.

filibuster (fil'i-bus-tėr), *n.* [< Sp. *filibustero* (with inserted *s* in first syllable) (= It. *filibustiere*), < F. *flibustier*, earlier *fribustier*, a filibuster, buccaneer, freebooter (with *s* inserted, but orig. not pronounced—a common fact in 17th century F., after the analogy of words in which an original *s* was retained in spelling, though it had become silent in pronunciation); < D. *vrijbuiter* (Kilian, 1598), now *vrijbuiter*, a freebooter, = E. *freebooter* = Dan. *fribytter* = Sw. *fribytare* = G. *freibeuter* (the E., Dan., Sw., and G. words being not independent formations, but formed after the analogy of the D. *vrijbuiter*, which appears to be the oldest form). In a Dutch work ("De Americaensche Zee-Roovers," 1678) written by a buccaneer named John Oexmelin, otherwise Exquemelin or Esquemeling, and translated into French and Spanish, and subsequently into English (1684), the adventurers of the West Indies are said to have been divided into three classes—the buccaneers (*boucaniers*) or hunters (see *buccaneer*), the filibusters (*flibustiers*) or rovers, and the farmers (*habitans*); and the *flibustiers* are said to have assumed their name "from the English word *flibuster*, which means rover"; this must refer to E. *freebooter*, but the D. form appears to be the original. The buccaneers consisted mainly of French, Dutch, and English adventurers, and not to any extent of Spaniards, with whom they were constantly at war; the Sp. form *filibustero* can only be an accom. of the F. *flibustier*; the *s* is now pronounced in F., etc., because, as now used, it is taken from the books, as spelled. The commonly assumed connection with E. *flyboat* (Sp. *filibote*, *filibote*, F. *flibot*, < D. *vlieboot*: see *flyboat*) has no support either in form or in historical fact.] 1. Hence—**2.** One of a band of men organized, in disregard of international law, for the purpose of invading and revolutionizing a foreign state. Both leaders were captured and put to death, the latter after having succeeded in his second object and exercised sovereign power for some time over Nicaragua. filter[1] (fil'tėr), *n.* [= D. Dan. Sw. *filter*, < F. *filtre*, a filter, OF. *feutre*, felt, a filter, F. *feutre*, felt.

= Sp. Pg. *filtro* = It. *feltro*, felt, < ML. *feltrum*, *filtrum*, felt: see *felt*[1], and cf. *felter*, *v.*, *feuter*.] **1.** A device for arresting and separating any matter mechanically suspended in a liquid. Filters used in the processes of analytical chemistry are made of paper or asbestos. The filter-paper is bibulous, consisting of nearly pure cellulose, with only bare traces of mineral matter. Many precipitates are more conveniently separated by an asbestos filter, the most common form consisting of an ordinary platinum crucible having the bottom perforated with fine holes which are covered with a thin asbestos felt. In the arts filters are used to purify water, syrups, vinegar, the juices of cane and fruits, oils, liquors, sewage, liquid by-products, and molten metals. The materials used in filtration are gravel, sand, charcoal, bone-black, sponge, fabrics, woven wire netting, asbestos, porous brick and stone, mineral wool, rope, paper, and powdered glass. The devices used to hold the straining material are in a great variety of forms, from a simple wick or loose cloth hung over the edge of a bowl of water and acting as a capillary strainer, to a settling-pond filtering 400,000 gallons of water in a day. The most common filter is a cone of bibulous paper, or a square of cloth sewed together to form a bag (called *Hippocrates's sleeve*). Filters also consist of porous brick or stone partitions, as in a cistern, or vessels partly filled with sand and gravel, or tubes filled with sponge, charcoal, or sand, etc. Domestic filters are used in connection with pumps and water-faucets. To cause the liquid to pass through a filter, the weight of a column of water, the pressure of the atmosphere, mechanical force from a screw or from steam-pressure, and centrifugal force are employed, as in the *centrifugal filter*, *oil-filter*, *vacuum-filter*, and many forms of pressure filters. Filters are also made reversible and intermittent, so that the filtering material may be freed from the collected sediment. In some pressure-filters the liquid or syrup is within a cylinder, and is forced outward through rings of fabric under steam-pressure; in others it is forced through a series of strainers piled one above another. Where bone black and charcoal are used, there is also a filtering or straining of a certain amount of gas and organic material that would pass through any other filter without detention. Filters are also used to remove dust and floating matter from air, but such devices are more properly termed *air-strainers*.

Having for trial-sake filtered it through cap-paper, there remained in the *filtre* a powder of a very deep and lovely colour *Boyle*, Works, I. 365.

filter-pump (fil'tėr-pump), *n.* An arrangement devised by the German chemist Bunsen, and much used by chemists to accelerate the filtering process. The atmospheric pressure is diminished in the vessel into which the filtered liquid passes by the aspirating effect of a stream of water flowing through a connecting tube, and the full atmospheric pressure on the surface of the liquid in the funnel forces the liquid through the pores of the filter paper or other material.

The paired fins are pectoral and ventral, the former homologous with the anterior member or manus (hand) of terrestrial vertebrates, the latter homologous with the posterior member or pes (foot). The relations of the spinous and soft portions of the dorsal and anal fins, and the position and structure of the ventral fins, as well as various other modifications of all the fins, have been much utilized for the classification and discrimination of groups in ichthyology. The names of the fins are commonly abbreviated A., C., D., P., V., as in the accompanying figure. In the lower fishes the fins are sustained in an erect position by numerous filamentary or slender rods (actinotrichia), but in the typical fishes there is a growing together of the actinotrichia into special rays or spines. In various forms (*Nematognathi*, *Salmonidæ*, etc.) there is likewise a pocket-like sac or ridge on the hinder part of the back, generally consisting of adipose matter and called an adipose fin. (*b*) In cetaceans and sirenians the caudal and (if present) the dorsal fins are simply extensions of integument and soft tissues without any skeletal framework, while the pectorals are homologous with the anterior limbs of quadrupeds, having the same bones concealed in the outgrown integument, but there are no outward indications of hind limbs as fins. (*c*) In seals and other aquatic carnivorous mammals the fore and hind limbs, more or less involved in the common integument, constitute fins or flippers. (*d*) In various aquatic reptiles there are fins like those of cetaceans, being either tegumentous expansions or pectoral limbs, or both, and pelvic limbs are also often present in the form of fins. (*e*) In aquatic batrachians, adult or larval, the tail is usually a fin, as that of the tadpole. (*f*) In birds the reduced and peculiarly modified wings of penguins constitute fins. (*g*) In numberless invertebrates some extended or expanded part or organ of the body, of no determinate homology, serves as a swimming-organ, and so constitutes a fin, as the expansion of the foot of a pteropod. See *pinna*, *flipper*.

finite (fī'nīt), *a.* and *n.* [= F. *fini* = Sp. Pg. It. *finito*, < L. *finitus*, pp. of *finire*, end, complete, finish: see *finish*. Cf. *fine*[2], *a.*, ult. a doublet of *finite*.] **I.** *a.* **1.** Not too great nor too small to be naturally susceptible of measurement, whether measurable by us or not; not infinite nor infinitesimal. All objects of ordinary experience are finite; God, eternity, immensity, and the like are not finite. Etymologically, *finite* means having an end or terminal; but this signification is not coextensive with the English use of the term. Thus, the circumference of a circle has no ends, yet is finite, while past time has an end, yet is not finite. So, if a finite arc be cut out of a parabola, what remains has two ends, yet is not finite.

The obvious portions of extension that affect our senses carry with them into the mind the idea of *finite*; and the ordinary periods of succession whereby we measure time and duration, as hours, days, and years, are bounded lengths. *Locke*, Human Understanding, II. xvii. 2.

The following are the special significations of the word: (*a*) As applied to a class or integer number, capable of being completely counted. this is the fundamental meaning. This distinction between a finite and an infinite class is very important, because there is a peculiar mode of reasoning, called by logicians reasoning by transposed quantity, which is applicable to finite classes alone. The following syllogism is an example. "Every Hottentot kills a Hottentot, but no Hottentot is killed by more than one Hottentot; hence, every Hottentot is killed by a Hottentot." If by the Hottentots is here meant a class of which a complete census might be taken, this conclusion must be true, provided the premises are true. But if the generations of Hottentots are everlasting, each Hottentot might kill one of his children, and yet some Hottentots might die natural deaths. Reasoning by transposed quantity is indispensable in the higher arithmetic and algebra, and consequently in these branches of mathematics the distinction between finite and infinite classes is very important. (*b*) As applied to continuous quantity, smaller than a suitably chosen finite number multiplied into the unit of measurement, and larger than a suitably chosen finite number divided by the unit of measurement.

On account of the *finite* speed of light, each star appears to describe in space a circle of fixed magnitude, in a plane parallel to that of the ecliptic. *Tait*, Light, § 60.

ing a negative particle, as *man*, opposed to *not-man*; also, a proposition containing only finite terms. (*b*) In *math.*, an integral is said to be expressed in *finite terms* when it is expressed without resort to an infinite series, although it may be expressed by means of exponential, elliptic, or Abelian functions which are synonymous with infinite series; but frequently expressions involving higher kinds of functions than the exponential and trigonometric are excluded.

II. *n.* That which is finite; finite things collectively: used only with the definite article.

First, That vessel in which the powers of steam are to be employed to work the engine, which is called the cylinder in common *fire-engines*, and which I call the steam-vessel, must, during the whole time the engine is at work, be kept as hot as the steam that enters it. *Watt*, quoted in Encyc. Brit., XXII. 475.

2. An engine designed to throw a continuous stream of water through a hose upon a conflagration, for the purpose of extinguishing it.

Fire-engine.

Fire-engines are of three principal kinds: *hand-power*, *steam*, and *chemical*, according to the power employed. Hand-power fire-engines consist in the main of a pair of single-acting force-pumps, mounted on wheels, and worked by hand. They have been generally superseded by the application of steam. Steam fire engines consist essentially of a pair of single-acting suction and force-pumps operated by steam, the whole apparatus being mounted on wheels and drawn by horses, or sometimes self propelled. The chemical fire-engine is a large form of fire-extinguisher mounted on wheels and drawn by horses. Floating fire-boats and steam fire-engines are used in large ports, for the protection of shipping and the water-fronts.

fire-escape (fīr'es-kāp'), *n.* Any apparatus or structure designed to enable persons to escape from the upper windows of a building in case of fire. Portable fire-escapes consist generally of ladders, often mounted on wheels for ease in transportation, and capable of being extended like a telescope; permanent fire-escapes consist usually of light iron ladders and landings attached to the outside of a building.

fire-extinguisher (fīr'eks-ting'gwish-ėr), *n.* An apparatus designed for immediate and temporary use in putting out a conflagration by means of a small stream of water or of water mingled with carbonic-acid gas. In the commonest form water is placed in a metal holder or vessel, and above it, within the holder, is placed a smaller vessel containing a chemical, as sulphuric acid, that may be set free by the turning of a handle or screw on the outside of the apparatus. Another chemical, commonly sodium bicarbonate, is also placed in the apparatus. When the acid is set free it combines with the sodium, setting free carbonic-acid gas, which, by its pressure, escapes when a nozle is opened, carrying the water with it in a strong stream. Such extinguishers are usually made portable, to be carried in the hand or upon the back, or are mounted upon a light truck to be drawn by a horse; but they are also made in heavier forms, when they are commonly called *chemical fire-engines*.

One of the commonest American species is a lampyrid, *Photinus pyralis*, vulgarly called *lightning-bug*. Its larva lives in the ground, feeding on earthworms and soft-bodied insects, and transforms to the pupa in an oval earthen cell in June, issuing as a beetle ten days later. In the genus *Photuris* the larva is luminous. The larger tropical fireflies belong to the elaterid genus *Pyrophorus*, and are known as *cucujos*. One of the most brilliant is *P. noctilucus* of South America and the West Indies, emitting such luminosity from two eye-like fe-

Buildings are rendered fire-proof by the exclusive use in their construction of non-combustible materials, as stone brick, iron, cement, concrete, and asbestos. In the case of textile fabrics, as cotton and linen, the means adopted is saturation with various salts, as borax, which leave their crystals in the substance of the fabric. Wood is best protected by silicate of soda, which on the application of strong heat fuses into a glass, and, not only enveloping the outside, but also filling the internal pores of the wood, shields it from contact with the oxygen of the air. All that can be done to protect combustible materials by any process, however, is the prevention of conflagration; no process yet known can prevent smoldering.

In an improved form two sheets of corrugated iron are riveted together at the edges, and connected at the top with a hose bringing water under pressure. The water fills the screen and escapes below. Hung on an elevated track before a furnace-door or suspended from a crane, it serves to absorb the heat from the furnace, and to keep the fire-room cool. When not required, it is rolled aside or lifted by the crane.

fire-ship (fīr'ship), *n.* A vessel freighted with combustibles and explosives and set adrift, for the purpose of burning or blowing up an enemy's ships, a bridge, or other object.

fire-shovel (fīr'shuv"l), *n.* [ME. not found; < AS. *fyrscofl* (in a gloss), < *fȳr*, fire, + *scofl*, shovel.] A shovel for lifting or removing coals of fire or ashes, or for placing coals on a fire.

2. A contrivance of inflammable and explosive materials combined in various proportions, for the purpose of producing in combustion beautiful or amusing scenic effects, or to be used as a night signal on land or sea, or for various purposes in war: commonly used in the plural. The basis of these compositions consists of potassium chlorate, niter, sulphur, and charcoal, pulverized, and combined in different proportions with other agents which have the quality of imparting color to the flame (as with copper sulphate for blue, strontium nitrate or carbonate for red, potassium salts for violet, sodium salts for yellow, barium carbonate or nitrate for green), and with iron- and steel filings to produce brilliant scintillations. These compositions are packed in cases of paper and pasteboard, generally cylindrical, the processes of packing and finishing demanding much skill and care. For scenic displays, the forms of fireworks most in use are the *fixed fires*, such as theater-fires, lances, and gerbes; *rotating fires*, as pin- or catharine-wheels, spiral wheels, etc.; *ascending fires*, as sky-rockets and girandoles; Roman candles; etc. As night signals or as incendiary projectiles, various pyrotechnic devices have been employed with success in military and naval operations. These devices consist of preparations used (1) in the service of cannon or cannon-ammunition, such as slow-match, quick-match, friction, electric, and obturating primers, port-fires, and fuses, (2) for signals, such as signal-rockets, signal-lights, blue lights, etc., with their decorations consisting of stars, serpents, gold rain, rain of fire, and marrons; (3) for incendiary purposes, as the carcass, incendiary match, and fire-stone, (4) for light, as tarred links, torches, light-balls, fire-balls, pitched fascines, and parachute-shells; (5) for offensive and defensive purposes, as bags of powder, petards, projectile rockets, as those of Congreve and Hale, light barrels, and dynamite or nitroglycerin cartridges. The most familiar of the many forms of fireworks is the sky-rocket, whether employed as a signal or for mere display, or as a projectile in war. An important use of the rocket is that of a line-carrier to establish communication between a wrecked vessel and the shore. The Chinese, if not the actual inventors of fireworks, were the first to use the rocket as a missile in war, and the pyrotechnic exhibitions of the Chinese and Japanese still surpass those of all other peoples in ingenuity and splendor. The Japanese have contrived an exhibition of fireworks by daylight, consisting of bombs which, exploding high in air, discharge jets or volumes of colored smoke which take the forms of birds, fishes, trees, and even of human beings. Fireworks are supposed to have been introduced into Europe by the Italians. They are mentioned in a description of a pageant at the marriage of Henry VIII and Anne Boleyn.

The king would have me present the princess . . . with some delightful ostentation, or show, or pageant, or antic, or *firework*. *Shak.*, L. L. L., v. 1.

All the hammocks were taken down, our ordnance loaded, and our powder chests and *fireworks* made ready.

Byron, Cain, ii. 1.

fire-worship (fīr'wėr"ship), *n.* The worship of fire, or of the god of fire, or of the divine as typified by fire; also, the ceremonial cult of a public or a family hearth, as practised, for instance, by all Aryan peoples, by all ancient Greek communities, by the vestal virgins of Rome, and in each ancient Greek and Roman family. The term *fire worship*, as specifically applied to the religion of the ancient Persians taught by Zoroaster, and practised by their descendants, the Guebers and Parsis of Persia and India, is, if taken literally, a misnomer derived from the Mohammedans, the fire being with these peoples merely a symbol of divinity and a visible sign of their religion. See *Gueber* and *Parsi.*

Fire-worship brings into view again, though under different aspects and with different results, the problems presented by water-worship. The real and absolute worship of fire falls into great divisions, the first belonging rather to fetishism, the second to polytheism proper, and the two apparently representing an earlier and later stage of theological ideas. *E. B. Tylor*, Prim. Culture, II. 251.

After vanquishing Moab and Ammon, both nations addicted to *fire worship*, he [David] showed no trace of mercy towards them. *Von Ranke*, Univ. Hist. (trans.), p. 47.

fire-worshiper (fīr'wėr"ship-ėr), *n.* A worshiper of fire; specifically, a follower of Zoroaster. See *Gueber* and *Parsi.*

There has been an error in imagining that the Persians and the ancient *fire-worshippers* were idolaters simply of fire, inasmuch as, in bowing down before it, they simply regarded Fire as a symbol, or visible sign, or thing placed as standing for Deity. *H. Jennings*, Rosicrucians, p. 79.

The so called *Fire-worshippers* certainly do not worship the fire, and they naturally object to a name which seems to place them on a level with mere idolaters.
Max Müller, Chips, I. 169.

When he was seven years old, all the kindred of his father's house, and all the friends thereof, assembled in the inner temple to see the high-priest invest him with the symbolic raiment of the *fire-worshipper*, "the garment of the good and beneficial way."
J. W. Palmer, The New and the Old, p. 273.

When the "withering" is finished, then follows the *firing*. The tea is placed in metal pans, set in a brickwork furnace, heated to a temperature of 240° or 250°; the leaves are turned incessantly . . . to prevent their burning; . . . they are then removed, . . thrown on tables, and rolled and sifted while hot

A firkin of honey was also 8 gallons, by a statute of 1581. A firkin of butter is 56 pounds (36 Geo. III.). A firkin of soap is 64 pounds or 8 gallons. Thus, by a statute of 1423 the firkin was 84 gallons; while by another of 1482 the firkin of fish was made 21 gallons, being one fourth of a butt and half a barrel. An Irish firkin was half a barrel or 100 pounds.

The barley firlot, used for barley, oats, fruit, potatoes, etc., contained 31 Scottish pints, or 3,205½ cubic inches, equal to 1¾ Winchester bushels. But the firlots in actual use were from 1 to 7 per cent. larger than the standards. The firlot was also used in the Isle of Man.

2. The sky or heavens; the vault of heaven, viewed as something solid and abiding; the region of the air. [The Hebrew word *rakia*, which is so rendered in Scripture, conveys chiefly the idea of expansion, although that of solidity is also suggested, inasmuch as the root signification of the word is 'that which is expanded by beating out.' The English *firmament* is adopted from the Latin *firmamentum*, which is the equivalent of the Greek στερέωμα (‹ στερεός, firm, solid), by which the writers of the Septuagint rendered *rakia*. Some old astronomers identified the firmament with the orb of the fixed stars; but the word never had any settled and exact meaning in astronomy.]

flag[2] (flag), *n.* [Early mod. E. *flagge* (= G. *flagge*), of D. or Scand. origin: OD. *vlagghe*, D. *vlag* = Sw. *flagg* = Dan. *flag*, a flag, orig. of a ship's flag; connected with Sw. dial. *flage*, flutter in the wind, and ult. with E. *flag*[1], *flack*, *flacker*, q. v. Cf. Icel. *flögra* = OHG. *flogarōn*, *flokrōn*, flutter; OHG. *flogezen*, MHG. *vlogzen*, *vlokzen*, flutter, flicker: connected with Icel. *flúga* (= OHG. *fliogan*, etc.), fly, = E. *fly*[1].] 1. A piece of thin, light fabric, especially bunting, usually rectangular and oblong or square, but sometimes triangular, notched, or otherwise varied in form, ranging from a few inches to several yards in dimensions, used hanging free from a staff to which it is attached or connected by one end, for many purposes, as a signal, symbol, cognizance, or standard, and differing in size, color, and emblematic marking or ornamentation, according to its intended use. The most common employment of flags is as military ensigns, colors, or standards, or emblems of nationality in all its modes of visible manifestation. In the army a flag is a banner by which one regiment is distinguished from another, and is usually called *the colors*. In the navy flags are borne at the masthead not only to designate the nationality of a vessel, but also to indicate the rank of the officer in command, an admiral's presence being denoted by his flag at the main, a vice-admiral carrying his flag at the fore, and

a rear-admiral at the mizzen. In the United States navy admirals' flags are blue, with four, three, or two stars, according to rank. When the President goes afloat, the national flag is displayed in the bow of his barge, or at the main of the man-of-war which receives him. In the British navy the supreme flag is the royal standard, which is to be hoisted only when the sovereign or one of the royal family is on board; the second flag has an anchor on a red ground, and characterizes the lord high admiral or lords commissioners of the admiralty; and the third is the union or national flag, in which the crosses of St. George, St. Andrew, and St. Patrick (the patron saints of England, Scotland, and Ireland respectively) are blended. This flag is appropriated to the admiral of the fleet. (See *ensign*, and *union flag*, under *union*.) The flag of the United States has since 1818 consisted of thirteen horizontal stripes (representing the thirteen original States of the Union), seven red and six white, placed alternately, with a blue union having displayed on it one white five-pointed star for each State in the Union. The Confederate flag had a similar union, but bore three bars, two red and one white, instead of the thirteen stripes. Flags are also used afloat and ashore for signaling. Flags are often raised on public buildings to show that they are open for business, or (as on the Capitol at Washington) that a legislative body is there in session. So, formerly, play-houses exhibited flags on their roofs when there were performances at them. When the players were out of employment, they were said to be *flag-fallen* (which see).

> 'Twas a shame, no less
> Than 'twas his loss, to course your flying *flags*,
> And leave his navy gazing. *Shak.*, A. and C., iii. 11.

During an engagement the bearer may be refused admittance into the lines, or he may be held. A flag of truce is regarded as especially sacred in character and significance, and any abuse of its privileges, as for the purpose of surreptitiously procuring military information, is condemned as an offense of peculiar heinousness. In naval engagements a flag of truce is met at a suitable distance by a boat from the senior officer's ship, in charge of a commissioned officer, and having a white flag plainly displayed from the time of leaving until her return. **Garrison flag**, a large flag furnished to the principal military posts in the United States, to be displayed on occasions of national importance.—**Knight of the square flag.** See *banneret*².—**Red flag.** (*a*) A flag of a red color with or without devices, associated with blood or danger: (1) The Roman signal for battle; hence, *to hang out the red* or *bloody flag* is often used, especially by earlier writers, to signify a challenge to battle.

(*c*) The bloody spout of a dying whale.—**To dip the flag**, to lower the flag and then hoist it again, as a token of respect or courtesy.—**To heave a flag aboard** (*naut.*), to hang it out. [Archaic or obsolete.]—**To hoist a flag at half-mast**, to raise a flag half-way up to its usual place as a token or signal of mourning.—**To strike** or **lower the flag**, to pull down the flag in token of surrender.—**White flag**, a flag of pure white material, with or without a device, used to denote a peaceable disposition or intention, to secure from molestation in time of war.

> By the semblance
> Of their *white flags* display'd, they bring us peace.
> *Shak.*, Pericles, i. 4.

Yellow flag, a flag of a yellow color used as a sanitary signal. It is displayed on a vessel to show that contagious or infectious disease exists on board, or that the ship or boat has been placed in quarantine; over the house, ship, or boat which serves as the residence of a quarantine officer; and in time of war to indicate hospitals or other houses containing the sick or wounded, that the enemy may refrain from firing on them. In this case it is called the *flag of protection*.

An association of flagellants founded in Italy about 1260 spread throughout Europe, its members marching in processions, publicly scourging their own bare bodies till the blood ran. Having by these practices given rise to great disorders, they were suppressed; but the same scenes were repeated on a larger scale in 1348 and several subsequent years, in consequence of the desolating plague called the "black death." These flagellants claimed for their scourgings the virtue of all the sacraments, and promulgated other heresies. There have been also fraternities of flagellants authorized by the Roman Catholic Church. Some flagellants have held doctrines opposed to the Roman Catholic Church, and approximating those of Protestantism.

A small flat or scale-like particle or fragment of anything; a thin fragment; a scale: as, a *flake* of tallow; a *flake* of flint; a *flake* of snow. As applied to chips or fragments detached from a mass of rock or mineral, *flake* often refers especially to such chips or fragments produced in the process of making stone weapons, especially in prehistoric times. Flint and obsidian are the materials which, in consequence of their characteristically conchoidal fracture, can most readily be made to take a desired form by chipping or flaking; but when these were not to be had, chert, jasper, quartz, and even rocks of various kinds, have been utilized in this way. There are many localities where these chips or *flakes* (as the larger and more regular chips are sometimes designated), cores, broken tools, stone hammers, and other similar relics, are found heaped together in large quantities, indicating the abandoned sites of workshops.

Cf. *phlegm* (formerly also *flem*, etc.).] **1.** A blaze; vapor in combustion; hydrogen or any inflammable gas in a state of visible combustion. Flame is attended with great heat, and generally with the evolution of much light; but the temperature may be intense when the light is feeble, as is the case with the flame of burning hydrogen gas. The flame of a burning body, as of a candle, may be divided into three zones: an inner zone, containing chiefly unburned gas; a central, containing partially burned gas; and an outer, in which the gas is completely consumed by combination with the oxygen of the air. The luminosity of flame depends upon the presence of solid matter or of dense gaseous products of combustion. The *reducing flame* (as of a blowpipe) is that part of the flame which is deficient in oxygen for combustion (RF in figure), and which has therefore a reducing effect, or, in other words, tends to deprive the substance under examination of oxygen; the *oxidizing flame* is that part (OF in figure) in which the oxygen is in excess, and which exerts the opposite or oxidizing effect. The distinction is important in blowpipe analysis.

Flamingos have extremely long slender legs and neck, a relatively small body, and large head, with a heavy bill bent abruptly in the middle and furnished with lamellæ like a duck's. The feet are webbed, and the whole structure is intermediate between that of grallatorial birds, like herons and storks, and natatorial birds, like the duck tribe. They thus constitute a superfamily group, called *Amphimorphæ*, from the equivocal structure. There are about eight species, of which the best-known is the common flamingo of the old world, *Phœnicopterus antiquorum*. The red flamingo of tropical and subtropical America is *P. ruber*, the African species is *P. minor*. There are two peculiar to South America, *P. ignipalliatus* and *P. andinus*. The form agrees only with that of ML. *flavor*, 'aurum *flavum*,' i. e., yellow gold, lit. 'yellowness'; < L. *flavere*, be yellow, < *flavus*, yellow: see *flavous*, *flavescent*. The connection of thought is not obvious; a clue has been sought in the point of view suggested in Milton's lines:

Desire of wine and all delicious drinks . . .
Thou couldst repress, nor did the dancing ruby,
Sparkling, outpour'd, the *flavour*, or the smell,
Or taste that cheers the heart of gods and men,
Allure thee from the cool, crystalline stream
Milton, S. A., l. 544

Here *flavor* appears to mean 'glowing color,' being a poetical application of the ML. *flavor*, lit. 'yellowness' (otherwise it can only be a synonym of *smell* or *taste* following). It is possible that the E. sense is due to association with ME. *flagre*, odor, in old Sc. *fleure*, *fleoure*, *fleowre*, *fleware*, *flewer*, a (bad) smell, the Sc. forms resting on F. *fleurer*, intr., smell, another form (by confusion with *fleur*, a flower) of F. *flairer*, tr., smell, scent, OF. *flairer*, intr., emit an odor: see *flair*[2]. *Savor* has also prob. influenced the meaning of *flavor*.] **1.** The quality of a substance which affects the smell; smell; odor; fragrance: as, the *flavor* of the rose. Flax (*Linum usitatissimum*), with section of seed-vessel

This species, of unknown origin, has been in cultivation from a very remote period, and yields the principal vegetable fiber in popular use over the larger part of the old world. The plant is an annual, with slender stems about two feet tall, which by various processes are freed from all useless matter, leaving the elongated bast-cells in the form of a soft, silky fiber. This fiber is used in the manufacture of linen thread and cloth, cambric, lawn, lace, etc. The principal sources of supply are Russia, Germany, the Netherlands, and Ireland. The flowers are blue. The seeds, known as *linseed* and *flaxseed*, are very mucilaginous, and are used on that account in medicine. They also yield an oil, which is extensively used by painters; and the residue, called *linseed-cake*, has much value as feed for cattle. The dwarf, fairy, mountain, or purging flax of England is *L. catharticum*, and the wild flax of the United States, *L. Virginicum* and *L. perenne*.

Order of the Golden Fleece, an order founded by Philip the Good, Duke of Burgundy, in 1430, on the occasion of his marriage with the Infanta Isabella of Portugal. The office of grand master passed to the house of Hapsburg in 1477 with the acquisition of the Burgundian dominions, which included the Netherlands. After the time of the emperor Charles V. (died 1558) this office was exercised by the Spanish kings, but after the cession of the Spanish Netherlands to Austria the latter power in 1715 again claimed the office. The dispute remains undecided, and the order therefore exists independently in Austria and in Spain. The badge of the order is a golden ram pendent by a ring which passes round its middle. This hangs from a jewel of elaborate design, with enameling of several colors, various suggestive devices, and the motto "Pretium laborum non vile."

Dan. *flint* = Sw. *flint* (in comp.), G. *flinte* (whence Bohem. and Pol. *flinta*, Lett. *plinte*), a gun: see *flint-lock*.] **I.** *n.* **1.** A form of silica, somewhat allied to chalcedony, but more opaque, and with less luster. It is usually of a light gray or brownish color. It has a peculiarly well-marked conchoidal fracture, and can easily be broken up into fragments having sharp cutting edges. For this reason, and because of its hardness, which is proverbial, flint was most extensively used in prehistoric times for all kinds of cutting implements. The use of flint as a means of striking fire with a steel, and especially as a part of the once almost universally used musket-lock, is well known. Flint occurs in large quantity in the form of nodules, and even sheets or beds, in the chalk of England and France, and has been formed by the slow replacement of carbonate of lime by silica held in solution in water. It is abundant in the United States, generally in massive forms. The exterior of most flints is of a lighter color than the interior, this difference being caused by a rearrangement of the particles of the silica.

Then he tooke up the Eldridge sworde,
As hard as any *flint*.

II. *a.* **1.** Made or composed of flint.—**2.** Hard and firm, as if made of flint: as, *flint* corn or *flint* wheat.—**Flint implements**, in *archæol.*, implements used by man before the use of metals, so called because, although occasionally found of granite, jade, serpentine, jasper, basalt, and other hard stones, those first studied, as well as the most numerous examples, are formed of flint. They consist of arrow heads, ax-heads or celts, lance-heads, knives, wedges, etc. Flint implements have been found in many regions of the globe; often, as in the Somme valley in France, in apparently upheaved beds of drift, and in connection with the remains of extinct species of the elephant, rhinoceros, and other mammals, whence man's existence on the globe at a geological period anterior to the present has been inferred. Flint implements are still used by some savage tribes.

flint-glass (flint'glȧs), *n.* A variety of glass in which the silica is combined with oxid of lead in greater or less quantity. The larger the amount of lead the higher the specific gravity and the refractive power, and the greater the brilliancy of the product. Flint-glass is often called *crystal glass*, or simply *crystal*, while some limit the name *flint-glass* to the variety specially made for optical purposes. Besides the oxid of lead, potash is an essential ingredient of flint glass or crystal. Analyses of different kinds of crystal show the presence of from 28 to 37 per cent. of oxid of lead, 14 to 17 of potash, and 52 to 59 of silica. The flint glass of Guinand, used for optical purposes and generally admitted to be of unrivalled excellence, contains about 43 per cent. of oxid of lead and 12 of potash. The brilliancy of crystal glass fits it for use for ornamental purposes, and especially for the most showy and expensive table ware. The characteristic luster and sparkle due to the high refractive power of the material is brought out by cutting and polishing, exactly as is done in the case of gems. Owing, however, to its softness, crystal glass is easily scratched by careless handling and dulled by wear. The name *flint-glass* originated in the fact that the silica first used in England for the manufacture of this article was derived from flints. An essential requisite for good flint-glass is purity of the materials employed, and the forms of the furnace and of the melting pots are peculiar. Great technical skill is required for the production of the best kind of glass for optical purposes. See *glass*, *strass*, and *lens*.

Flounders feed upon aquatic insects, worms, and small fishes, and sometimes acquire the weight of 4 pounds. The common flounder is an inhabitant of the Northern, Baltic, and Mediterranean seas. (*b*) In the eastern United States, the common flounder is the *Pseudopleuronectes americanus* or the *Paralichthys oblongus*, here figured. (*c*) In California, and along the western coast generally, the *Pleuronectes stellatus* is known as the flounder. In other parts of the world colonized by the English the name is transferred to some common representative of the family *Pleuronectidæ*

=Syn. *Fluctuate, Vacillate, Waver, Oscillate, Undulate*, apply to literal or figurative movements to and fro, or up and down; but *undulate* is used only physically, as of the sea, sound-waves, etc. *Fluctuate, waver*, and *undulate* in their figurative uses are founded upon the rise and fall of waves; *oscillate* refers to the swinging of a pendulum. *Vacillate*, and next to it *waver*, suggests the most of mental or moral indecision. *Oscillate* naturally suggests the most regular alternations of movement to and fro. *Vacillate* and *waver* are now rarely used of physical things, *waver* is also used of a hesitation that seems likely to end in yielding.

flue[1] (flō), *n.* [= Sc. *flow*. Origin obscure; perhaps connected with MD. D. *vloegh*, grooves, channels, the flutes of a fluted column. There is no evidence to connect the word with OF. *flue, fluve*, a flowing, a stream (< L. *fluvius*, a stream). Skeat considers *flue* to be "a mere corruption of *flute*," citing in support of this view the use in Phaer's Virgil (see extract under def. 2); but such a corruption of an established word like *flute* at the period concerned is scarcely possible; Phaer's *flue*, if not a misprint for *flute*, is prob., like *flue* in organ-building (def. 3), merely a deflected use of *flue* in the ordinary sense, with some ref. to the accidentally similar *flute*.] **1.** A duct for the conveyance of air, smoke, heat, or gases. The form *fluff*, also spelled *flough* (?), points to an orig. guttural (W. *llwch*, dust, powder ?). Cf. Dan. *fnug* = Sw. *fnugg*, down, motes, flue, Dan. *fnok*, pappus. II. *n.* 1. A substance which flows or is capable of flowing; a substance which is incapable of resisting forces (tangential stresses) tending to change its shape without altering its size. A *fluid* has absolutely no tendency to spring back to its original shape when distorted, except in virtue of a surface tension. A *perfect fluid* is a fluid in which a bending stress produces an instantaneous strain—that is to say, there is no delay in taking a form of equilibrium, except what is due to the masses of the particles: opposed to a *viscous fluid*, in which the yielding is not instantaneous, and to a *plastic solid*, which yields instantaneously to a sufficient, but not to a very small, stress. Fluids are divided into liquids and gases or vapors. Gases or *elastic fluids* tend to

expand indefinitely while preserving their homogeneity; liquids or *inelastic fluids* tend to expand indefinitely, but only by evaporation — that is, by separating into two parts with a bounding surface between them. (See *liquid*, *gas*, and *ether*.) In the early history of physical science the phenomena of heat, electricity, and magnetism were supposed to be due to the motions of peculiar imponderable fluids; hence the expressions *north* and *south magnetic fluid*, the *electrical fluid*, etc., which still linger (but not with good writers), though the explanation of the phenomena has changed with the advance of knowledge.

A *fluid* is a body the contiguous parts of which act on one another with a pressure which is perpendicular to the surface which separates those parts.
Clerk Maxwell, Heat, p. 95.

Fluidism supposes that the ordinary physical body is like a core or nucleus of a more extensive body, which reaches in all directions beyond the visible surface of the natural body, and is capable of producing certain effects.

fluorescence (flō-ō-res'ens), *n.* [= F. *fluorescence* = Sp. Pg. *florescencia*; as *fluorescen(t)* + *-ce.*] The property possessed by some transparent substances of becoming self-luminous while they are exposed to the direct action of light-rays. See *phosphorescence.* It is especially excited by the violet and ultra-violet rays of the spectrum, and is explained by the change in refrangibility (that is, wave-length) of the incident rays by the substance under experiment. Thus, if a beam of sunlight fall upon a solution of esculin or sulphate of quinine, its path through the liquid is marked by a bluish opalescent light. Again, if a paper moistened with the solution is exposed to the ultra-violet rays of the spectrum, it becomes blue, since these rays are diminished in refrangibility so as to become visible; by this means the ultra-violet spectrum (given by prisms of quartz) can be studied. The delicate blue surface-color of some fluor-spar and the yellowish-green surface-color of glass colored with uranium oxid (canary glass) are phenomena of the same nature. For some years previous to 1852 the phenomenon was termed *epipolic dispersion.*

fluorin, fluorine (flō'ō-rin), *n.* [< *fluor* + *-in*[2], *-ine*[2].] Chemical symbol, F; atomic weight, 19.05. A gaseous element, not known in a free state, since its isolation is a matter of great difficulty and of some doubt. It forms with other elements a group of compounds called *fluorides.* The commonest of these is calcium fluoride, or fluor-spar. Fluorin occurs abundantly in the mineral kingdom, as in fluor-spar, cryolite, and other minerals, and also in minute quantity in the teeth and bones of animals.

It consists essentially of a tube or box closed at one end by a screen coated with a fluorescent substance, as tungstate of calcium. When an object, as the hand, placed before a vacuum-tube is observed through the fluoroscope, the shadows of its parts that are not transparent to the X-rays are seen on the fluorescent screen.

fluor-spar (flō'ōr-spär), *n.* [< *fluor*, a flow, flux (see def.), + *spar*[1].] A common mineral, the fluoride of calcium, CaF_2, found in great beauty in Derbyshire, England, and hence also called *Derbyshire spar.* It occurs both massive and crystallized, in simple forms of the isometric system, namely the cube, octahedron, dodecahedron, etc., and in combinations of these. Pure fluor-spar contains 48.7 per cent. of fluorin and 51.3 of calcium. It is of frequent occurrence, especially in connection with metalliferous beds, as of silver, tin, lead, and cobalt ores. It is sometimes colorless and transparent, but more frequently exhibits tints of yellow, green, blue, and red. From the general prevalence of a blue tint in the Derbyshire specimens, it is there known as *blue-john.* It is often beautifully banded, especially when in nodules, which are much prized for the manufacture of vases, and occasionally used for beads, brooch-stones, and other ornamental purposes, although it is of inferior hardness. Some varieties exhibit a bluish fluorescence; and all kinds phosphoresce on gentle heating, especially the variety chlorophane, which emits a beautiful green light. The name *fluor* has reference to its use as a flux to promote the fusion of certain refractory minerals. Also called *fluorite.*

flush. The several words spelled *flush*, being mostly dialectal, colloquial, or technical, and scantily recorded in early literature, have become partly confused with one another, and cannot now be entirely disentangled. Words originally different have acquired some meanings very nearly identical, while on the other hand there are some meanings not obviously related which are, nevertheless, to be referred to one original. The separation made in the following articles is based on the present differences of sense, and is probably more minute than the etymology, if fully known, would require.]

having a mouth-hole in the side of the tube, which is held across the player's body. In both species finger holes in the tube control the pitch of the tones; and in both increased force in blowing raises the pitch an octave. The exact explanation of the production of the tone is somewhat uncertain. It is asserted that the stream of air, being usually flat, acts like a free reed in the opening, playing back and forth like a solid tongue.

The *flying-fishes* proper, forming the subfamily of Exocœtines, are distinguished from other exocœtids by the development of the pectorals, which are elongated and capable of considerable horizontal extension, so that the fish is buoyed up in the air, which it reaches by vigorous movements of its stout tail and caudal fin. . . . The species of the family are pelagic, and representatives are found in almost all the tropical and warm seas. They associate together in schools of considerable size. The aerial flight is not strictly entitled to the name, for the pectoral fins are not used in active progression, but are simply employed as parachutes. . . . The former is called a *real*, the latter a *virtual focus*. The *principal focus* of a lens is the focus of rays striking the lens parallel to its axis. The *conjugate foci* of a mirror or lens are two points so situated that the rays emitted from a luminous body at either point are reflected (by the mirror) or refracted (by the lens) to the other. See *conjugate mirror* (under *conjugate*), *lens*, and *mirror*.

A *focus* . . . may be defined as the point to which a spherical wave converges, or from which it diverges. It may also be defined as the point at which little waves from all parts of a great wave arrive at the same time.

Every lens which becomes thicker towards its periphery has virtual *foci*; and vice versâ, for the *focus* of a lens to be real, the lens must be thicker in the middle than at the edge. *Lommel*, Light (trans.), p. 90.

2. In *geom.*, a point from which the distances to any point of a given curve are in a syzygetic relation. Thus, the sum of the distances of any point of an ellipse from its foci is constant, and the difference of the distances of any point of a hyperbola from its foci is constant. A modern definition is that the foci are the intersections of common tangents of the curve and the absolute. In like manner, a focus of a surface is a point on the curve of intersection of common tangent planes of the surface and the absolute. See cuts under *Cartesian* and *ellipse*.

3. In the theory of perspective, with reference to two planes in perspective, one of four points —two, F_1 and F_2, on one plane, and two, f_1 and f_2, on the other—such that the angles between two points on the first plane measured at F_1 are equal to the angles between the corresponding points on the other plane measured at f_1, and so with the pair of foci F_2 and f_2. One pair of foci are called *similar*, because the angles are measured in the same direction on the two planes; the other pair are called *dissimilar*, because the angles are measured in opposite directions.

4. Figuratively (with a consciousness of the classical Latin meaning), a central or gathering point, like the fire or hearth of a household; the point at or about which anything is concentrated; a center of interest or attraction.

While your head is still under the focusing-cloth, pass your hand round to the lens, and move the rack backward and forward till you find the point at which it is most distinct. It is then said to be "*in focus*," or "sharp."

The aggregation of a vast number of minute globules of water in the air near the earth's surface, usually produced by the cooling of the air below the dew-point, whereby a portion of its vapor is condensed. The cooling may be the result of radiation, conduction, mixture with colder air, or ascension. Over surfaces of water warmer than the air the fog produced by cooling is increased by the continued evaporation of the water into the already saturated air. Solid particles in the air constitute nuclei for condensation, and are thereby great promoters of the formation of fog. In a ship's log-book, abbreviated *f.*

Therefore the winds, piping to us in vain,
As in revenge, have suck'd up from the sea
Contagious *fogs*.
Shak., M. N. D., ii. 2.

Foliation may be congenital with the formation of the rock itself, or posterior to it: in the latter case the epithet *foliated* indicates a structure not essentially different from that more generally designated as *schistose*. The relations of foliation to cleavage are somewhat obscure. The essential difference between them appears to be that cleavage is rarely well developed except in fine-grained, argillaceous rock, which by its effects is usually rendered capable of almost indefinite subdivision in one direction, while foliation separates the rock into bands sometimes quite distinct from each other in mineral character, these bands being also not infrequently more or less irregular in thickness and rather lenticular in form. By some geologists it is thought that in foliation a more advanced stage of metamorphism has been reached than that indicated by cleavage; but it is also highly probable that the original lithological and structural character of the mass had much to do with bringing about the observed differences. See *schist* and *schistose*.

In the dark crag. *Tennyson*, Princess, iii.

In man the feet are the terminal segments of the posterior limbs, corresponding to the hands or the anterior extremities, and extending from the ankle joint or tibiotarsal articulation to the end of the toes. The foot is divided into three parts, the tarsus or ankle, the metatarsus or instep, and the phalanges, digits, or toes. It contains 26 bones: namely, 7 tarsals, the astragalus, calcaneum, scaphoid, cuboid, and 3 cuneiform bones; 5 metatarsals; and 14 phalanges, 3 to each of the digits except the great toe, which has 2. The axis of the foot is at right angles with that of the leg, and the whole sole rests upon the ground. The principal muscles acting upon the foot are the anterior and posterior tibial, the three peroneal, the gastrocnemii and soleus, and the flexors and extensors of the toes. In many mammals the structure of the foot is much the same as in man, especially in those which are plantigrade; but the term is extended usually to the corresponding segment of the fore limb. In digitigrade mammals which walk upon the toes, as cats and dogs, or upon the ends of the toes, as in hoofed quadrupeds, the foot, properly speaking, extends up the limb: thus, in the horse, for example, the feet reach up to the hock of the hind limb and the so-called knee of the fore limb (see cut under *perissodactyl*); but in popular language *foot* is restricted to the phalangeal part of the foot, which rests on the ground in walking. In birds the foot is properly the whole of the hind limb up to the tibiotarsal joint, commonly but wrongly called the knee, and includes the tarsometatarsus and toes; but it is popularly restricted to the toes alone. In reptiles and batrachians which have limbs, the foot is the terminal segment of either fore or hind limb, as in other vertebrates. The hind foot is technically called the *pes*.

Bones of Human Foot, or Pes, the third principal segment of the hind limb, consisting of tarsus, metatarsus, and phalanges.

a, astragalus; *ca*, calcaneum; *n*, navicular, or scaphoid; *co*, cuboid; c_1, c_2, c_3, entocuneiform, mesocuneiform, and ectocuneiform, or inner, middle, and outer cuneiform bones. The foregoing seven bones constitute the tarsus, and m_1 to m_5, first to the fifth metatarsal, constitute the metatarsus. The remaining fourteen bones are the phalanges, three to each digit excepting the great toe. *h*, distal phalanx of the hallux or great toe.

2. In invertebrate animals, some part serving the purpose of a foot. (*a*) In mollusks, any surface or part of the body upon which the animal rests or moves. It is often extensile or protrusible, as in gastropods, and is technically called the *podium*. See cuts under *Heteropoda* and *Lamellibranchiata*. (*b*) In insects, specifically, the tarsus. (*c*) In arthropods, the leg. The modifications of the limbs have different names, as *swimming-feet* or *pleopods*, *ambulatory feet*, etc. (*d*) In worms, one of the bristly appendages called *parapodia*. See cut under *prostomium*. (*e*) In echinoderms, a tubular prolongation of the body through an ambulacrum. See *tube-foot*. (*f*) In protozoans, a temporary prolongation of the body, called a *false foot*. See *pseudopodium*.

10. A unit of length, originally the length of a man's foot. Abbreviated *ft.* The English foot (in use in the United States) contains 12 inches, and is equal to 30.48 centimeters. It seems to have slightly lengthened since the time of Henry VII. The feet in use in different European countries before the introduction of the metric system varied from 9 to 21 English inches. The ancient Roman foot is known from a number of extant standards to have been equal to 11.65 English inches. Other ancient feet are of uncertain length, even when their existence is not in doubt; especially, there is at present much dispute concerning the Attic foot. (See *geometrical foot*, below.) The following table gives the prevalent opinions concerning the lengths of the ancient feet and well-determined values of the more important modern units of this name, all expressed in English inches:

11. In *pros.*, a group of syllables, of which one is distinguished above the others, which are relatively less marked in enunciation; a section of a rhythmical series consisting of a thesis and an arsis. The Greeks first gave the name *foot* (*πούς*) to the group of times marked by and coincident with one rise and one fall of the human foot in dancing or in beating time. The time or syllable marked alike by the ictus or stress of voice, and by the beat of foot or hand in marking time, they accordingly called the *thesis* (*θέσις*) or 'setting down' (of the foot), and the remaining interval before or after this the *arsis* (*ἄρσις*) or 'raising' (of the foot). Many Latin and modern writers have introduced great confusion into metrical nomenclature by directly interchanging the meaning of the words *arsis* and *thesis*. (See *arsis*.) An uninterrupted succession of feet constitutes a colon or series, and the name *line* or *verse* is given to a colon, cola, or period, if written in one line. In accentual poetry, as in English, and other modern languages in which the syllable accent is chiefly a stress of the voice, the rhythmical ictus regularly coincides with the syllable accent, and the relative length of time taken in pro-

nouncing a syllable is almost entirely disregarded. In the poetry of the Greeks, Romans, Hindus, and other nations in whose languages the syllabic accent was chiefly a matter of tone or pitch, quantity — that is, the length of time taken in pronouncing each syllable — determined the rhythm. In Greek and Roman rhythmics and metrics a unit of time is assumed, called a *primary* or *fundamental time* or *mora*, or specifically a *time*, and this is regarded as the ordinary or normal short (marked ⏑), and expressed in verbal composition by a short syllable. The ordinary or normal long (marked –) is equal to two times or moræ, and is expressed by a long syllable. Metrical classification of such feet is based either on metrical *magnitude* — that is, on the length of the foot as measured in moræ or times, each long being reckoned as two shorts — or on the *pedal ratio* — that is, the proportion of the number of times in the thesis to that in the arsis.

12. In *music:* (*a*) A drone-bass. (*b*) A chorus or refrain; a burden. (*c*) In *organ-building:* (1) The part of a pipe below its mouth. (2) A measure or name used in denoting the pitch of stops. The standard of reference is the length of an open pipe belonging to the second C below middle C. A unison stop is called an 8-foot stop, because in this case the pipe is about 8 feet long. Similarly, an octave stop is called a 4-foot stop; a double or suboctave stop, a 16-foot stop, etc. (See *stop*.) The usage has been extended to the designation of the pitch of particular tones and of instruments. Thus, the second C below middle C is called 8-foot C, and all the tones in the octave above it 8-foot tones, or tones in the 8-foot octave, while the first C below middle C is called 4-foot C, etc. Thus, also, the piccolo is called a 4-foot instrument, because its tones are an octave above the notes written.

Washing of feet, a ceremony in the Roman Catholic, Greek, Russian, and some other churches, as those of the Dunkers, Winebrennerians, etc., in commemoration of Christ's washing of the feet of his disciples after the last supper (John xiii. 4–17), both as a symbol of spiritual cleansing and as a lesson to them of humility and good will. The washing of others' feet, for their relief from the effects of exposure in a hot climate with but slight or no covering, has always been a common practice in Oriental countries, generally performed by menials; and religious ideas have often been associated with the practice. In the Roman Catholic Church the ceremony is observed on Thursday of Holy Week. The pope washes the feet of thirteen poor priests, and the principal priests or prelates of the Roman Catholic churches wash the feet of twelve poor persons. The ceremony is also called *mandatum* or *maundy*. See *Maundy Thursday*.

> Overcometh the winter with driving the *foote-ball*,
> Forgetting labour and many a grievous fall.
> *Alex. Barclay*, quoted in Strutt's Sports and Pastimes, [p. 169.

2. A game played with such a ball by two parties of players on a level plot of ground, at each end of which is a goal through or beyond which the players strive to drive the ball. There are various ways of playing the game, the two most commonly recognized being the "Association" and the "Rugby" game, the latter either in its original form or as played in America in a modified form. The field is 330 feet long by 160 wide, and in the middle of each end is a goal formed of two upright posts, in the Rugby game 18½ feet apart with a cross-bar 10 feet above the ground, and in the Association game 24 feet apart with a cross-bar 8 feet from the ground. There are 11 players on each side (in the Rugby game sometimes 15), divided into *rushers* and *backs;* the special object of the former being to check their opponents and to rush or push forward the ball in a body, and of the latter to kick or run with the ball. The two sides cast lots, the winner having the privilege of beginning the game with possession of the ball, or of selecting the goal. In the Rugby game the players can kick, run with, or throw the ball (but not throw it forward toward their opponents' goal); in the Association game they can only kick it. The playing is begun by *kicking off* the ball from midway between the goals, and the players strive to force the ball through or beyond their opponents' goal. In the Association game, to win a goal the ball must be kicked through the goal below the cross-bar, and the side securing the largest number of goals wins the game. In the Rugby game scoring is by *goals, touch-downs,* and *safety touch-downs* or *safeties*. A goal is won by kicking the ball through or above the goal-posts over the cross-bar; a touch-down, by carrying the ball behind the goal and there touching it to the ground, which gives the player a *try* — that is, the right to carry the ball out in front of the goal and try to kick a goal; a safety touch-down or safety, by forcing one's opponents to touch the ball to the ground behind one's own goal. The play continues for a certain length of time (in 1899 one hour and ten minutes), divided into two parts by a short intermission, at which time the players change sides. Football is an ancient game, probably introduced into Great Britain by the Romans, though the first distinct mention of it is in Fitzstephen's History of London, about 1175.

for-[1], [< ME. *for-*, < AS. *for-* = OS. *far-* = OFries. *for-* = D. *ver-* = MLG. *vor-*, LG. *for-* = OHG. *fir-*, *far-*, MHG. *ver-*, G. *ver-* = Icel. *for-* (rarely *fyr-*, *ir-*) = Sw. *för-* = Dan. *for-* = Goth. *fra-*, *faur-*, *fair-*: a prefix involving several different developments (oppositeness, negation, difference, change, deterioration) of the radical meaning 'before,' and varying in its force accordingly; akin to *for*, *fore*[1], etc., and ult. to the L., Gr., and Skt. forms cited under *for*. The three Goth. forms *faur-*, *fair-*, *fra-*, are phonetically near to Gr. παρά, before, beside, περί, around, and πρό, before, respectively. See further under *for*, *prep*. In some words *for-*[1] has become confused with *for-*[2], equiv. to *fore-*[1]; e. g., *forego*[2] for *forgo*[1], *forward*[1] for *foreward*[1], *forward*[2] for *foreward*[2], etc. See *for-*[3].] An inseparable prefix in words of Middle English and Anglo-Saxon origin, formerly attachable at will to any verb admitting of the qualification conveyed by this prefix, but no longer used or felt as a living formative. In Middle English and Anglo-Saxon it conveyed various notions, as oppositeness, negation, difference, change, deterioration, etc., often intensity, these notions being traceable in the modern words; thus, *for-* is negative in *forbid*, *forswear*, negative or pejorative in *forspeak*, etc., alterative in *forshape*, etc., intensive in *forlorn*, *forweary*, *forwounded*, *forspent*, etc. From its intensive use in participial forms of verbs it came to be used also as an intensive prefix to adjectives, as in *forblack*, very black, *fordry*, very dry, etc. (See the etymology, and compare *for-*[3].) This prefix, once extremely common, has not only ceased to be used in forming new words, but most of the old words containing it have become obsolete, *forbear*[1], *forbid*, *forget*, *forgive*, *forgo*[1], *forsake*, *forswear*, and *forlorn* in its adjective use being the only ones now in familiar use. Only the principal Middle English words with this prefix are entered in this dictionary.

foraminifer (fō-ra-min'i-fėr), *n.* [< NL. *foraminifer*: see *foraminiferous*.] One of the *Foraminifera*.

Foraminifera (fǭ-ram-i-nif'ę-rą̈), *n. pl.* [NL., neut. pl. of *foraminifer*: see *foraminiferous*.] An order of *Rhizopoda*, belonging to the subkingdom *Protozoa*, furnished with a shell or test, simple or complex, usually perforated by pores (foramina), whence the name. The shell may be composed of horny matter, or of carbonate of lime secreted from the water in which they live, or may be fabricated by sticking together extraneous matters, such as particles of sand. Owing to the resemblance of their convoluted chambered shells to those of the nautilus, they were at first reckoned among the most highly organized mollusks. In reality they are among the simplest of the *Protozoa*. The body of a foraminifer is composed of granular, gelatinous, highly elastic sarcode,

which not only fills the shell, but passes through the perforations to the exterior, there giving off long thread-like processes, called pseudopodia, interlacing one another so as to form a net like a spider's web. Internally the sarcode-body exhibits no structure or definite organs of any kind. A nucleus, which at one time was believed to be absent, has been discovered in these organisms. A remarkable formation known as *nummulitic limestone* receives its name from the presence of large coin-shaped foraminifers, generally about as large as an English shilling. The name is based on the French *foraminifères* of A. d'Orbigny, who regarded these organisms as cephalopodous mollusks, and named them from the foramina by means of which the cells communicate. He divided them into *Helicostègues* (with the subdivisions *H. nautiloides*, *ammonoides*, and *turbinoides*), *Stichostègues*, *Enallostègues*, *Agathistègues*, and *Entomostègues*, terms corresponding to *Helicostega*, *Stichostega*, *Enallostega*, *Agathistega*, and *Entomostega*. The most approved recent classification of the *Foraminifera* is by H. B. Brady, who divides the order into the families *Gromidæ*, *Miliolidæ*, *Astrorhizidæ*, *Lituolidæ*, *Textulariidæ*, *Chilostomellidæ*, *Lagenidæ*, *Globigerinidæ*, *Rotalidæ*, and *Nummulinidæ*. The problematic fossil of the Laurentian rocks of Canada, named *Eozoon canadense*, has been referred to the order, but its foraminiferal nature has been denied by most recent naturalists. By some authors the *Foraminifera*, under the name *Reticularia*, are regarded as a class of protozoans, and divided into 10 orders, corresponding with the above-named families. *Thalamophora* is a third name of these organisms.

8. In *physics*: (*a*) Strictly, the immediate cause of a change in the velocity or direction of motion of a body; a component acceleration, due to a special cause, paired with the mass of the moving body; a directed or vector quantity of the dimensions of a mass multiplied by an acceleration or rate of change of a velocity, this quantity representing the instantaneous effect of any definite cause affecting the motion of a body. The distinct mechanical apprehension of force is modern. Archimedes discovered the elements of the theory of the pressures upon bodies at rest, but it was not until the seventeenth century that, by the labors of mathematicians from Galileo to Newton, the general mode in which bodies move became sufficiently understood to give a perfectly definite meaning to the word, and indeed the development of the idea has not yet ceased. A particle infinitely remote from others, so that no special influences would work upon it, would retain a velocity constant in amount and direction. The effect of any cause is to produce an alteration of velocity; and when this happens the cause is said to exert *force* upon the particle. The explanation of what is meant by a *force* is dependent upon the mechanical notion of the composition of motions, according to which, for example, if a man walks on the deck of a ship, his motion relatively to the sea is said to be compounded of his motion relatively to the ship and of the motion of the ship relatively to the sea. In general terms, if a particle which at any instant is at any point of space, A, has a partial or component motion which at the end of a second would carry it to a point B, and at the same time has another component motion which would carry it in the same time to a point C, the result of the two motions will be that it is carried to a point D, such that ABCD is a parallelogram, as in the figure. It necessarily follows that accelerations of velocity are compounded in a similar manner: namely, if a particle is at any instant under such circumstances that according to a law of nature its velocity undergoes the acceleration represented by the line AB, while at the same time, owing to other circumstances, it undergoes another alteration represented by the line AC, these two alterations are compounded by the same principle; and if the point D completes the parallelogram ABCD, the alteration represented by the diagonal AD is the result of compounding the two other alterations. This is called the principle of the *parallelogram of forces*. The *polygon of forces* is merely a complicated application of the same principle, according to which, if the velocity of a particle experiences several simultaneous alterations, represented by all the successive sides but one of a polygon taken in one continuous order, the result is an alteration represented by the last side in the direction of the last point from the first. The operation of thus compounding several simultaneous changes of velocity is termed the *composition of forces*, the partial changes are termed *components*, and the result of the operation the *resultant*. When a body is under the influence of a *force*, it has what is called a tendency to motion, which consists in its actually receiving, under all circumstances, in each unit of time, so long as the force acts, a motion in a definite direction and of fixed amount, which motion is compounded with the motion already impressed upon the body, together with the effects of other *forces* to which it may be simultaneously subject. Thus, every body at the surface of the earth, in consequence of the *force* of gravity, actually receives an increase of downward velocity at the rate of 32 feet per second; and if it does not fall on the whole, it is because it is at the same time, in consequence of the elastic compression of the support upon which it rests, projected upward with the same increase of velocity per second. The component forces when due to definite causes are also called *impressed forces*; the resultant of all of them is called the *effective force*. By the same principle, any alteration of velocity may be separated into several, and this is called the *resolution of forces*, although no one of the components may represent the total effect of any definite cause. When a velocity or alteration of velocity is thus resolved into three components at right angles to one another, each is termed the *resultant resolved* in that direction. By the law of action and reaction, whenever a body has its velocity altered owing to any cause, some other body has its velocity altered in precisely the opposite direction. The alterations are not of equal magnitude, but when each is multiplied by a quantity which is constant for each portion of matter undergoing an alteration of velocity—this constant being termed the *mass* or *amount of matter*—the two products are equal. All alterations of velocity take place gradually and continuously. The rate of change of velocity, together with its direction, coupled with or multiplied by the mass of the body undergoing the change of motion, is a *force*, properly so called, or *accelerating force*. According to this, the accepted view of the matter, *force* is nothing occult, but is simply the product of a mass by a component acceleration due to a definite position relatively to another body or to some other circumstance. Nevertheless, many writers regard *force* as an occult something which causes or explains the alterations of the velocities of bodies; and no writers who employ the word at all altogether avoid the use of phrases which seem to bear such a meaning. An *impulsive force* is the amount of a sudden finite change of motion multiplied by the mass of the moving body; it is not supposed there really are any such forces, but it is occasionally convenient to regard forces as impulsive. A *force* is defined by its intensity or amount, its direction, its point of application, and the time at which it exists. The *point of application of a force* is the particle which is immediately and directly affected by it.

Parallelogram of Forces.

Forces, then, is of two kinds, the stress of a strained adjoining body, and the attraction or repulsion of a distant body. *W. K. Clifford*, Lectures, II. 26.

Loosely—(*b*) Any mechanical cause or element. This use of the word, which dates from before the development of clear conceptions of dynamics, is now obsolete with physicists except in special connections. Older writers speak of momentum and even of inertia as a *force*. Such expressions, and even the reference to pressures as *forces* (except in the phrase *centrifugal force*), are now obsolete. On the other hand, accelerations are still frequently called *forces*. Energy is now rarely termed *force*, except in the phrase *living force* (vis viva): thus, in technical language, it is no longer correct to speak of the *force* of the waves or of a cannon-ball, but of their *power* or *energy*. Special affections of matter giving rise to *force*, such as elasticity and electrification, are frequently called *forces*, although they are properly powers. Other phenomena, such as electricity, light, etc., are still loosely called *forces* by some technical writers.

If we accept *force* as the dynamic aspect of existence, the correlate of matter, we have a firm, speculative foundation for the first law of motion, which expresses in an intelligible formula both the constancy of existence and the varieties of its distribution.
G. H. Lewes, Probs. of Life and Mind, II. v. § 13.

See *ablatitious*.—**Active force.** See *vis viva*.—**Animal force**, that force which results from the muscular power of men, horses, and other animals.—**Arm of a force.** See *moment of a force*, under *moment*.—**Cartesian measure of force.** See *Cartesian*.—**Catalytic force.** See *catalytic*.—**Center of force.** See *center*[1].—**Central force.** See *central*.—**Centrifugal force.** [NL. *vis centrifuga*: a term introduced by Huygens in 1673. The principle had been vaguely employed by the ancient astronomer Aristarchus to explain why the moon does not fall to the earth.] (*a*) Properly, a quantity of the dimensions of a force, the product of the mass of a particle

moving along a curved path into a component accelerative elongation of the radius of curvature of the path ($md^2\rho/dt^2$), due to the inertia of the particle; inertia considered as the cause of such acceleration. If, while a wheel is revolving uniformly, a particle is suddenly released from its periphery, this particle will (in the absence of forces) fly off on a tangent without change of velocity. The path of the particle, considered as relative to the revolving wheel, is an involute of the circle. Hence, at the instant of release the direction of the relative motion of the particle is radial to the wheel, and it can be shown that, while the velocity of this motion would be null at that instant, its acceleration would be equal to the square of the velocity of the particle divided by the radius of the wheel. It is simplest to say that this accelerative elongation of the radius vector always takes place, and that if, notwithstanding, the particle does not leave the wheel, it is because the centrifugal acceleration due to inertia is precisely balanced by a centripetal acceleration due to the forces which hold the particle in place. But the centrifugal force does not at all depend upon the principle of action and reaction. If a particle moves upon any curved path whatever, any infinitesimal part of this path is osculated by a circle, and inertia will produce the same accelerative elongation of the radius vector from the center of this circle as before; and this radius vector is the radius of curvature of the path. As thus defined, the centrifugal force is not a true force, since it results from the resolution of the motion into a radial and a circular part, while the principle of the parallelogram of forces (see def. 8 (*a*)) forbids such a resolution of forces proper. Thus, if a particle moves in a circular orbit about an attracting center, since the radius of curvature is constant, the centrifugal force must be balanced by a precisely equal and opposite attracting force. But a body which was really subjected to two equal and opposite forces would move as if subjected to none — that is, not in a circle, but in a straight line. The fact is that the only influences to which the body is subjected are I, its inertia, and A, the attraction — that is, I + A. The centrifugal force is equal to —A, and balances the attraction, but it is a part of the inertia, the remainder of which is I + A. (*b*) In an erroneous use, a repulsive force causing a revolving body to fly away from the center of revolution. Writers on attractions sometimes so use the word. (*c*) A fictitious force repelling every particle of the earth from the axis by an amount equal to the centrifugal force in sense (*a*) With this hypothesis, and supposing the earth not to rotate, the statical effects are the same as in the actual case; but the dynamical effects are different. (*d*) As used by many high authorities, the reaction of a moving body against the force which makes it move in a curved path. In this sense it is a real force. It does not, however, act upon the moving body, but upon the deflecting body; and, far from giving the former a tendency to fly away from the center, it is but an aspect of that stress which holds it to the curved trajectory. The centrifugal force in sense (*a*) may be regarded as that in sense (*d*) transferred from the deflecting to the deflected bodies. [These differences of meaning explain the apparently conflicting views of writers.]

When I was about nine years old I was taken to hear a course of lectures, given by an itinerant lecturer in a country town, to get as much as I could of the second half of a good, sound, philosophical omniscience. . . . "You have heard what I have said of the wonderful centripetal force, by which Divine Wisdom has retained the planets in their orbits round the Sun. But, ladies and gentlemen, it must be clear to you that if there were no other force in action, this centripetal force would draw our earth and the other planets into the Sun, and universal ruin would ensue. To prevent such a catastrophe, the same wisdom has implanted a *centrifugal force* of the same amount, and directly opposite," &c. I had never heard of Alfonso X. of Castile, but I ventured to think that if Divine Wisdom had just let the planets alone it would come to the same thing, with equal and opposite troubles saved. *De Morgan*, Budget of Paradoxes, p. 431.

Deviating force and *centrifugal force* are but two different names for the same force, applied to it according as its action on the revolving body or on the guiding body is under consideration. *Rankine*, Applied Mechanics, § 538.

The student cannot be too early warned of the dangerous error into which so many have fallen, who have supposed that a mass has a tendency to fly outwards from a centre about which it is revolving, and therefore exerts a *centrifugal force* which requires to be balanced by a centripetal force. *Tait*, Encyc. Brit., XV. 682.

Although the earth is really revolving about its axis, so that all problems relating to the relative equilibrium of the earth itself and the bodies on its surface are really dynamical problems, we know that they may be treated statically by introducing, in addition to the attraction, that fictitious force which we call the *centrifugal force*.
Stokes, On Attractions, § 1.

Centripetal force, a force which draws a body toward a center. — **Chemical force.** See *chemical*. — **Coercive** or **coercitive force.** See *coercive*. — **Complex of forces, component of a force, congruency of forces,** etc. See *complex*, *component*, etc. — **Composition of forces.** See *composition*, and def. 8 (*a*), above. — **Compound force,** in *law*, unlawful violence attended by another crime: distinguished from *simple force*. — **Conservation of force.** See *the law of the conservation of energy* or *of force*, under *energy*. — **Conservative force,** an attraction or repulsion depending upon the relative position of the pair of bodies concerned. All fundamental forces are believed to be conservative or fixed. Whatever motion takes place under the influence of conservative forces alone might take place under the same forces in precisely the reverse order, the velocities being the same, but opposite in direction. A determinate order among phenomena is therefore never due to the action of forces, but is a result of probabilities. — **Corpuscular force,** a force which, like cohesion and adhesion, acts between the molecules of a body or of different bodies; molecular force. — **Correlation of energies** or **of forces.** See *energy*. — **Decomposition of forces.** Same as *resolution of forces*. — **Defective force.** See *defective*. — **Deviating force** or **tangential force,** a force acting in a direction at right angles to that of the motion of the body, and producing a curvature of its path. — **Diffusion of force.** See *diffusion*. — **Distributed force,** in *mech.*, a force which is not applied at a point, but is spread over a surface or disseminated through a solid. All real forces are distributed. — **Electromotive force.** See *electromotive*. — **Equilibrium of forces.** See *equilibrium*, 1. — **Equivalence of force.** See *equivalence*. — **External forces,** those forces which act upon masses of matter at sensible distances, as gravitation. — **Fine force**†. See *fine*², 16. — **Fixed force.** See *fixed*. — **Force Bill,** in *U. S. hist.*: (*a*) A bill to enforce the tariff, introduced into Congress at the time of the nullification excitement in 1833. It became a law **March 2d, 1833.** (*b*) A bill for the protection of political and civil rights in the South. It became a law May 31st, 1870. (*c*) A bill similar to (*b*), but of still more stringent character, enacted April 20th, 1871. — **Force of detrusion.** See *detrusion*. — **Force of inertia.** See *momentum*. — **In great force,** exceedingly vivacious or energetic; in effective condition: generally applied to powers of conversation or oratory: as, he was *in great force* at the dinner or the meeting last night. [Colloq.] — **Internal forces,** forces which act only on the constituent particles of matter, and at insensible distances, as cohesion. — **Line of force.** See *equipotential surface*, under *equipotential*. — **Living force.** See *vis viva*. — **Magne-crystallic force.** See *magne-crystallic*. — **Molar force,** a force producing motions in large masses of matter. — **Molecular force,** a force acting between molecules, but insensible at sensible distances. — **Moment of a force.** See *moment*. — **Moral force,** the power of acting on the reason in judging and determining. — **Motive power** or **force.** See *motive*, *a.* **Moving force.** See *momentum*. — **No force**†, no matter; no consequence. See def. 6, above, and *to make no force*, below.

Non-conservative forces, forces which depend upon the velocities of the bodies between which they act. Such forces are alone capable of setting up rotations. Friction and viscosity are examples of such forces, and these are explained by physicists as the result of chance encounters, etc., among almost innumerable molecules. Other effects of this sort are the conduction of heat, the dissipation of energy, the development of living forms, etc. — **Odic force, odylic force.** See *od*. — **Of force**†, of necessity; necessarily; unavoidably; perforce.

Good reasons must, *of force*, give place to better.
Shak., J. C., iv. 3.

This prince, *of force*, must be belov'd of Heaven,

Triangle of forces. See *triangle*. — **Tube of force.** See *tube*. — **Unit of force.** See *unit*. — **Syn.** *Strength*, etc. (see *power*); efficacy, efficiency, potency, cogency, virtue; *Force*, *Compulsion*, *Coercion*, *Constraint*, *Restraint*. Among these *force* is the most general. *Compulsion* and *coercion* are generally more active, pushing one onward; *constraint* and *restraint* less active, the last being simply a holding back. The first three could be applied to a person's treatment of himself only by a lively figure; *constraint* and *restraint* express equally self-control and control of others. *Constraint* upon one's self is much harder than *restraint*.

By *force* they could not introduce these gods;
For ten to one in former days was odds.

forest (for'est), *n.* and *a.* [Early mod. E. also *forrest;* < ME. *forest,* < OF. *forest*, F. *forêt* = Pr. *forest, foresta* = Sp. Pg. *floresta* (simulating Sp. Pg. *flor*, flower) = It. *foresta* = MHG. *vorest, forest, forst* (and prob. ML. *foresta* also means a private fish-pond or fishing-place; in both senses it appears to involve the notion of interdiction (as regards cultivation or common use); cf. ML. *forestare*, proscribe, put under ban, lit. put outside or apart; ML. LL. *forasticus*, out of doors, public, ML. *forestarius*, strange, foreign, outside; all < L. *foris, foras*, outside, out of doors: see *foreign*.] I. *n.* 1. A tract of land covered with trees; a wood, usually one of considerable extent; a tract of woodland with or without inclosed intervals of open and uncultivated ground.

> Ettricke *Foreste* is a fair *foreste*,
> In it growes manie a semelie trie.
> *Song of the Outlaw Murray* (Child's Ballads, VI. 22).

This is the *forest* primeval. The murmuring pines and the hemlocks . . .
Stand like harpers hoar, with beards that rest on their bosoms. *Longfellow*, Evangeline, Prol.

2. In Great Britain, a designation still retained for some large tracts of land or districts formerly but not now covered with trees or constituting royal forests (see below), especially such as have some of the distinctive characteristics or uses of wild or broken woodland, as the Forest of Dean in England or some of the deer-forests of Scotland.

> We have many *forests* in England without a stick of timber upon them. *Wedgwood*, Dict. Eng. Etymology.

3. In *Eng. law*, and formerly also in *Scots law*, a territory of woody grounds and pastures privileged for wild beasts and fowls of chase and warren to rest and abide in, generally belonging to the sovereign, and set apart for his recreation, or granted by him to others, under special laws, and having officers specially appointed to look after it; a hunting-preserve maintained at public expense for royal or aristocratic use: specifically called a *royal forest.* Such forests were once very numerous, and often of great extent; but most of them have been disafforested, and those still kept up are now chiefly used as public pleasure-grounds.

> *Forests* are waste grounds belonging to the king, replenished with all manner of chase or venery; which are under the king's protection, for the sake of his recreation and delight. *Blackstone*, Com., I. viii.

It may happen that the wastes of two or more manors adjoin, and sometimes the common, or moor, or whatever it may be called, is a *royal forest*—that is, a hunting preserve created since the Conquest. The presence of trees, I need hardly say, is not required to make a *forest* in this sense. The great mark of it is the absence of enclosures. *F. Pollock*, Land Laws, p. 40.

Charter of the Forest. See *charter.*—**Drift of the forest.** See *drift.*—**Forest-bed group,** in *Eng. geol.*, a division of the so-called *crag* (which see). It is but a few feet in thickness, but is exposed for many miles along the coast of Norfolk. It contains a great variety of organic remains, among which are cones of trees, leaves of various plants, land-shells, and bones of mammalia, birds, and reptiles.—**Ordinance of the forest.** See *ordinance.*—**Pure forest,** a forest consisting wholly of one kind of trees: in contradistinction to a *mixed forest*, in which the trees are of several kinds.—**Right of forest,** the right or franchise of keeping, for the purpose of venery and warren, all animals pursued in field sports in a certain territory or precinct of woody ground and pasture.—**Submarine forest,** a geological phrase applied to beds of impure peat, consisting of roots, stems, and branches of trees, etc., occupying the sites on which they grew, but which by change of level are now submerged by the sea. Such submarine forests do not contain any trees that are not found growing at the present time. They belong to the recent or Quaternary period, and occur above the boulder-clay. They have been traced for several miles along the margins of the estuaries on the north and south shores of the county of Fife in Scotland.—**Syn.** *Forest, Wood, Woods, Woodland, Grove, Chase, Park.* Of some of these words the earlier and the later uses differ very much. *Forest* implies a large body of trees growing naturally, or the tract considered as covered with trees. It formerly always implied the presence of animals of the chase. *Wood* or *woods* is like *forest*, except in being smaller. *Woodland* differs from *woods* in emphasizing the land or tract upon which the trees stand. A *grove* is a cluster of trees not sufficiently extensive to be called a *wood*. A *chase* is, in strictness, open *woods* of indefinite extent, especially set apart for hunting; but the word survives as applied to places from which the animals have disappeared. A *park* is primarily an inclosure of considerable size; the word is now often applied to a piece of land set apart for public recreation and more or less elaborately adapted by art to that end, as Regent's *Park* in London and Central *Park* in New York.

> He [William the Conqueror] ordered whole villages and towns to be swept away to make *forests* for the deer. Not satisfied with sixty-eight royal *forests*, he laid waste an immense district to form another in Hampshire, called the New *Forest*. *Dickens*, Child's Hist. Eng., viii.

It. *forma* = D. *vorm* = MHG. *forme*, G. *form* = Icel. *formr* = Dan. Sw. *form*, < L. *forma*, shape, figure, image, outline, plan, mold, frame, case, etc., manner, sort, kind, etc., ML. also a bench, choir-stall, grade in a school, etc. (with many other meanings). There is no ground for the attempted distinction, in pronunciation and spelling, between *form*, shape, etc., and *form* (spelled *fourm* in Bailey), a bench, etc.] **1.** The external shape or configuration of a body; the figure, as defined by lines and surfaces; external appearance considered independently of color or material; in an absolute use, the human figure: as, it was in the *form* of a circle; a triangular *form*; the *form* of the head or of the body; a beautiful or an ugly *form*.

2. Specifically, in *crystal.*, the complex of planes included under the same general symbol. Thus in the isometric system the most general form is the hexoctahedron, embracing forty-eight similar planes. In the triclinic system a form, even in the most general case, includes only two similar planes, and is called an *open form*, since it does not represent an inclosed solid or *closed form*; similarly, the two basal planes in the orthorhombic system constitute a form.

3. Attractive appearance; shapeliness; beauty. [Archaic.]

He hath no *form* nor comeliness. Isa. liii. 2.

4†. A costume; a special dress: as, a blue silk *form*.

5. A mold, pattern, or model; something to give shape, or on or after which things are fashioned: as, a hatters' or a milliners' *form;* a *form* for jelly.—**6.** In *printing*, an assemblage of types secured in a chase for stereotyping, or of either types or plates for printing. A form may consist of one page or of many pages. For stereotyping, no particular order of arrangement is necessary; for printing, the pages are arranged in such order that in folding the printed sheet they will fall in regular sequence. In book-printing, before the general use of steam-presses, two forms (see *inner* and *outer form*, below) were usually required for a sheet, one being separately printed on each side; now a single form frequently comprises a whole sheet, the paper being turned end for end for printing the second side. Large newspapers, however, still require two forms. In this sense often spelled *forme* in Great Britain. **7.** In *milit. engin.*, same as *gabion-form*. See *gabion.*—**8.** In general, arrangement of or relationship between the parts of anything, as distinguished from the parts themselves: opposed to *matter*, but not properly to *substance* (unless it be the intention of the writer to identify substance with matter). Thus, to say that the soul was immaterial was formerly considered the same as to say that it was a *form*. With the older writers *form* is often synonymous with *essence*, and has generally lofty associations (thus, the shape of a living being, considered as its perfection, was called its *form*, while that of a lifeless thing was called its *figure*, but not its *form*); and these ideas cling to the word in the minds of later writers, as Kant. But with many modern writers the conception is of something imposed upon the thing from without, and distinct from its life and essence. In metaphysics *form* denotes a determination, a specializing element, that constituent of a thing by virtue of which it is the kind of thing that it is. In the Platonic philosophy the *form* is the exemplar according to which a thing is made, or the mold, as it were, in which the thing is cast. In the Aristotelian philosophy *form* is the developed actuality, *matter* the undeveloped potentiality; *matter* is that element by virtue of which the thing is, *form* is that by which it is as it is — that is, the nature or essence of the thing. In Bacon's philosophy the *true form* is the physical structure or constitution of anything. In Kant's philosophy *form* is that element of an object which is imported into it by the mind: opposed to the *matter*, which is given in sense. For various other metaphysical applications of the term, see phrases below.

The figure comprehendeth the shape of things that have no life, as the facion of the elements, of trees, of flouddes, of an house, a shippe, a cote, and soche like. The *fourme* contoineth the portraiture of al livyng thinges, as the very livelie image of man, of an horse, or a lion, as we cal a man wel favoured or harde favoured.
Sir T. Wilson, Rule of Reason (1551).

Though I shall for brevity's sake retain the word *form*, yet I would be understood to mean by it, not a real substance distinct from matter, but only the matter itself of a natural body, considered with its peculiar manner of existence, which I think may not inconveniently be called either its specifical or denominating state, or its essential modification; or, if you would have me express it in one word, its stamp. *Boyle*, Origin of Forms.

Of a beautiful landscape, melody, or poem, the blending of unity with variety appears not only in the grouping of Sense-Elements ("*form*" in the narrow meaning), but also in that of the represented content or signification of these. *J. Sully*, Outlines of Psychol., p. 536.

In a phenomenon, I call that which corresponds to the sensation its matter; but that which causes the manifold matter of the phenomenon to be perceived as arranged in a certain order I call its *form*.
Kant, Critique of Pure Reason (tr. by Max Müller), p. 18.

The distinction above specified is employed by Aristotle in his exposition of the soul. The soul belongs to the category of substance or essence (not that of quantity, quality, etc.); but of the two points of view under which essence may be presented, the soul ranks with *form*, not with matter—with the actual, not with the potential.
Grote, Aristotle, p. 457.

Time and space are not given in sensation. They are not the sensational matter of perception, but something that "makes it possible for us to represent all parts of that matter as arranged in certain relations to each other"; and this we may fairly call the *form* of perception.
E. Caird, Philos. of Kant, p. 234.

9. A specific formation or arrangement; characteristic structure, constitution, or appearance; disposition of parts or conditions.

Whan the Duke herde that in the same *forme* he moste come a-geyn, he vndirstode wele he sholde bringe with hym Ygerne. *Merlin* (E. E. T. S.), i. 69.

This notion of "ought," when once it has been developed, is a necessary *form* of our moral apprehension, just as space is now a necessary *form* of our sense-perceptions.
H. Sidgwick, Methods of Ethics, p. 93.

To many the battle of the giants, over the "long," the "middle," and the "short" *form* or recension of the Ignatian Epistles, will be an intellectual treat, as he watches the fence and scholarship of the various disputants.
Quarterly Rev., CLXII. 474.

15. Mere appearance; semblance.

Why keep up a *form* of separation when the life of it is fled? *Lamb*, Imperfect Sympathies.

16. High condition or fitness for any undertaking, as a competition, especially a physical competition; powers of competing.

In the language of the turf, when we say that a horse is in *form*, we intend to convey to our hearers that he is in high condition and fit to run. So, again, the word is used in still another sense; for we speak of a horse's *form* when we wish to allude to his powers on the turf, as compared with other well-known animals. Thus, if it be supposed that two three-year-olds, carrying the same weight, would run a mile and a half, and come in abreast, it is said that the *form* of one is equal to that of the other.
J. H. Walsh, The Horse, vi.

The substantial form has four marks: it does not directly affect the senses; it has no variations of degree (though this was disputed); it is good and perfect; it is the principle or origin of the properties and operations of that to which it pertains. Much use was made by the medieval logicians of the doctrine of *substantial forms*, and thus the absurdity of trying to explain the properties and operations of things by means of mere abstract statements was put in a strong light, which the conflict with the real explanations of science soon heightened. Thus, if the Newtonian law of gravitation were merely a transformation of Kepler's laws, and implied nothing further, it would be of the nature of a substantial form; but in point of fact it predicts the various lunar equations, the planetary perturbations, the precession of the equinoxes, the tides, and the figure of the earth.—**Theory of forms**, the theory of the changes of algebraic forms due to linear transformations of their variables; especially, the theory of invariants, reciprocants, etc.—**To take form**, to assume a definite shape, appearance, or order; become definite and clear: as, the conception gradually *took form* in his mind. = **Syn. 1.** *Shape, Fashion*, etc. See *figure, n.*—**13.** *Rite, Observance*, etc. See *ceremony*.

=Syn. 3. *Forsake*, *Desert*, *Abandon*, *Relinquish*, *Quit*. These all express the idea of giving up or leaving. The first three are strong expressions, ordinarily conveying the idea of loss to that which is left; the fourth, on the other hand, suggests loss to him who *relinquishes*. *Forsake* is chiefly applied to leaving that by which natural affection or a sense of duty should or might have led us to remain: as, to *forsake* one's home, friends, country, or cause; a bird *forsakes* its nest. In the passive it often means left desolate, forlorn. *Forsake* may be used in a good sense: as, the color *forsook* her cheeks; even hope *forsook* him. *Desert* may be synonymous with *forsake*, but in the active voice it usually implies a greater degree of culpability, and often the infringement of a legal obligation: as, to *desert* one's family, regiment, ship, colors, post. Such was the original use of the word. *Abandon* most fully expresses complete and final severance of connection: as, to *abandon* a ship or a hopeless undertaking; to *abandon* hope or property. Sometimes, but not so often as *desert* or *forsake*, it implies the dropping of all care or concern for an object: as, to *abandon* one's offspring. *Relinquish* is not used with a personal object: as, to *relinquish* a claim, land, effort. (See lists under *relinquish* and *abandon*.) To *quit* is to leave finally or hastily, or both.

When my father and my mother *forsake* me, then the Lord will take me up. Ps. xxvii. 10.

II. *n.* 1. Any rock or mineral, or any mineral substance, whether of an organic or of an inorganic nature, dug out of the ground.—2. Specifically, in later geological and mineralogical use, anything which has been buried beneath the surface of the earth by natural causes or geological agencies, and which bears in its form or chemical composition the evidence that it is of organic origin. Thus, the shell of a mollusk may be preserved unchanged, in both form and chemical composition; or, while retaining its original form, it may have been converted into silica; or it may have disappeared entirely, leaving only a cast as evidence of its former existence; or there may remain only a mold of its interior, formed after the soft parts had entirely decayed: in any of these cases, the specimen or fragment of rock which thus shows by its form that it, either wholly or in part, belonged to an organic body, or that its configuration resulted from the presence of something having had an organized existence, would be properly called a *fossil*. Even the rocks showing traces of trails, footprints, bored cavities, or other evidences of contact with organic life, are usually designated as *fossils*. The bones or other remains of species now living on the earth, if buried by any recent catastrophe, such as a flood or landslide, would not, as a general rule, be designated as *fossil*, but would be called *recent*. If, however, such an entombment took place in prehistoric times, the term *fossil* would by most geologists be used in describing the occurrence in preference to *recent*.
3. Hence, figuratively, one who or something which is antiquated, or has fallen behind the progress of ideas; a person or thing of superannuated or discarded character or quality: as, a curious literary *fossil*.—**Dyestone fossil**. Same as *dyestone ore*. See *dyestone*.
